

# About DevOps

dev+ops=profit!

No  
deployment at  
Friday  
5:59:59pm!

Ops  
being  
a\*\*\*\*\*  
refused  
to  
deploy

**AGAIN,  
WHAT  
ABOUT  
QA??????**

# What is DevOps?

Job Title ?

Software/Tools?

Save the world?

# According to Borat, DevOps is...

**DevOps Borat** @DEVOPS\_BORAT · 5 Apr 2013

In startup we are gamify site outage. Three outage and ops team is out.

↳ 625 ❤️ 245 ...

**DevOps Borat** @DEVOPS\_BORAT · 23 Mar 2013

Attention devops! Make of sure you have strong plan C. Plan A and B are never work.

↳ 472 ❤️ 194 ...

**DevOps Borat** @DEVOPS\_BORAT · 11 Mar 2013

Every PaaS can able be reduce to 120 Perl script.

↳ 192 ❤️ 53 ...

**DevOps Borat** @DEVOPS\_BORAT · 11 Mar 2013

In startup we are practice Outage Driven Infrastructure.

↳ 466 ❤️ 215 ...

**DevOps Borat** @DEVOPS\_BORAT · 8 Mar 2013

Dirty secret of Big Data is you can not able deploy if you not have SQL expert on staff.

↳ 148 ❤️ 45 ...

**DevOps Borat** @DEVOPS\_BORAT · 8 Mar 2013

You can not able have unlimit scalability without unlimit outage.

↳ 165 ❤️ 52 ...

# So, What is DevOps?

**DevOps** (a clipped compound of "development" and "operations") is a **culture, movement or practice** that emphasizes the collaboration and communication of both software developers and other information-technology (IT) professionals while automating the process of software delivery and infrastructure changes.

- From Wikipedia, so *must be correct!*

# Did you notice?

It is not just Dev + Ops!

QA is in the Venn Chart!

Yes, Quality Assurance is part of the DevOps equation!

# Why DevOps?

Continuous Delivery = lots of deployment

Traditionally, lots of friction between Ops and Dev.

“Your code broke my production!”

“Your production broke my code!”

“Ops refuses to deploy...”

“Devs are being careless...”

...

Facebook used to say “Move fast and break things!”

Time to move fast and break things!

# Automation

Automation = predictability

Automation = faster/shorter turnaround

Automation = less error prone

Automation = faster for error to propagate

Automation = more effort up front

Automation = deep understanding on the system

# What to automate?

Deployment

Setup

Regression test

Standard Error Recovery

Notification

Log collection/rotation

Security Scan

Monitoring

# But before automate it,

Understand the system

Understand the code

Understand the business impact

Understand the business requirement

Understand the need for automation, not everything needed to be automated

# Automation tools

Best tool for automation is still

**BASH + PERL/Python!**

# Why QA automation?

Imagine if the system can do deployment for every commit to the master branch!

Imagine if the regression test suite has 10000 test cases!

Imagine if you have team of 10 developers!

Imagine if your project milestone is measured in days!

Well, without Test Automation, your QA will hate you, really really hate you!

# TDD/ATDD/BDD

Unit Tests to cover function consistency!

`add(3,4)` always return 7

Acceptance Tests to cover feature/function expectation!

Login page should always display login field and password field

Behavioural Tests to cover features flow consistency!

Login with correct user ID and password combination should allow user to login and redirect us to user landing page

# TDD

Java: JUnit

PHP: PHPUnit

Javascript: Jasmine, QUnit

almost all popular programming languages have its own unit test framework(s)

# BDD, Gherkin

**Feature:** Some terse yet descriptive text of what is desired

In order to realize a named business value

As an explicit system actor

I want to gain some beneficial outcome which furthers the goal

**Scenario:** Some determinable business situation

**Given** some precondition

**And** some other precondition

**When** some action by the actor

**And** some other action

**And** yet another action

**Then** some testable outcome is achieved

**And** something else we can check happens too

**Scenario:** A different situation

...

# Test Automation

Jenkins + Selenium

Multiple parallel execution

using cloud to dynamically scale out test executions

JBehave + Selenium

# Why test automation

Would you have sex 5 times a day with random stranger without condom?

Would you do 5 deployments a day with random code change without test automation?

# Deployment Automation

Git, do you know git enough?

Jenkins/Bamboo

CircleCI, Travis, or millions of CD SAAS wannabe.

Chef/Puppet/Ansible/... for system management

Or using ssh+bash/perl/Python/nodejs

# Monitoring

Nagios, Monit, Pingdom, ...

You don't want to be the last one to know production is down, trust me, you don't!

Pager Duty, Ops Genie for alert escalation

have a good escalation policy

Logstash, Fluentd, Apache Flume, scribe, or rsyslogd

Log everything... disk is cheaper than your hours of debugging

disk space concern? Logrotate to the rescue!

New Relic, Data Dog, Cloud Watch

# System

Package management: YUM, Apt-get

htop!

VIRT vs RES vs SHR

service, systemctl, /etc/init.d

iostat

netstat

sed, awk, cut, grep/egrep, sort, uniq, head, tail, more, less, find, uname, wget,  
curl, sudo, dmesg, netcat, ssh, scp, ps, lsof, tar, gzip, touch, which, echo, cat,  
chmod, chown, chgrp, bash, w, uptime, man

# What about Docker?

Not enough hand-on experience to comment

Virtualbox works for me, so I am sticking with it. Vagrant is good if you want to have tool to manage your virtualbox VMs.

Why docker? light weight and simple setup to have production quality setup on your computer.

# Network

PING!

But Ping is so old school, use mtr!

telnet!

Challenge: can you fetch google homepage using telnet??

telnet is very useful for connectivity check

how to tell the differences between firewall blocking and no app/service listening to the port?

Wireshark, extremely powerful, also extreme complex

Nginx (not just a web server...)

# Security

XSS Scanner: OWASP Xenotix, w3af

SSH!!!!!!

SELinux

Sudo, no one login as root

Suricata, Kismet, etc for IDS

Check and read **OWASP!!!!**

# So What is DevOps?

Tools?

Automation?

Test? TDD? BDD?

Jenkins?

Chef, Puppet?

AWS?

Monitoring? Alert? Dashboard?

Security?

# DevOps is

Empathy

Communication

Ownership

Responsibility

Progressive

Quality

don't be an asshole...

helping the team

# DevOps is not

about tools... all the greatest tools in the world, still no one want to work with an asshole

about CI/CD... deliver a broken software is not DevOps

about automation... automated error delivery system is not DevOps

about monitoring... that poor guy can't click on a button on a webpage really doesn't care if you get paged in the middle of night, he just wants to click to go to the next page!

about agile, but it does work well with Agile Manifesto

QA replacement

# Disclaimer

All slides before are strictly IMHO.. :) Enjoy coding, testing, deploying and all the midnight calls! When in doubt, ask Google...

Oh, Windows, what about windows? Please ask Weihan... LOL
